

What happens to your organics?

Ever wonder what happens to your organic material once it gets picked up?

1 First, it is taken to the composting facility and unloaded.

2 Once off the truck, the material is put through a grinding process.

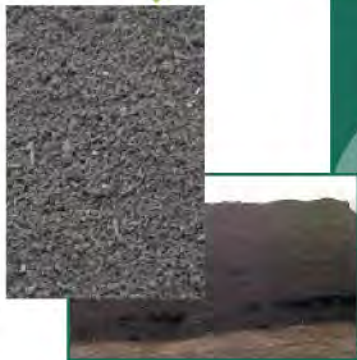

3 The material is screened to a specified size.

4 The screened material is moved into windrows.

5 The windrows are turned and watered to speed up the composting process.

6 After curing, the result is a nutrient-rich compost used in farming, gardening and landscaping.
